

Top Gear® MECHANICS GUARD/FENDER COVERS

The Bagmasters' three styles of **Top Gear** mechanics' guard/fender covers are produced to cover the broad spectrum of the automotive industry—from the dealership after-market service centre, through to the tuning centres and specialist automotive workshops. There is also a cover among the three for the auto accessory stores.

The **Proline** cover has been designed to meet all of the 'on the job' requirements of the modern-day customer service oriented service centre. It was designed by the people who, in the course of their daily profession, lean over/into the engine bay—78 auto mechanics. They informed us that what they required in a guard/fender cover was:

- an easy to clean front surface
- impact absorbing
- a large tool gutter
- a soft surface against the paint finish
- shaped around the wheel arch
- weighted roll to hold the cover securely on the guard/fender

The **Top Gear Proline** mechanics guard/fender cover has all of these features built into it and more. As an additional safety feature and a bonus to the end user, we chose fire-resistant materials for the production of our best cover.

The Bagmasters' **Autoline** and **Workline** guard covers are produced to established designs and patterns with the added Bagmasters' touch of product excellence in the choice of materials used and the production techniques employed in our workshop. **Autoline** and **Workline** may look like 'that other one' but do not be deceived—they are different!

Good **Workline**

- The front panel is a non-supporting PVC to which is laminated a foam rubber backing material. The foam backing provides both a soft finish for the paint surface and adhesion to hold the cover in place on the guard/fender.
- The tool gutter on the Workline is 100 mm (4 inches) wide.

Better **Autoline**

- The front panel is a cotton back vinyl, as used for industrial aprons and furniture upholstery.
- The rear panel is a soft, brushed fabric chosen to protect the paint finish.
- Tool gutter for holding tools/parts.
- Weighted, desiccated silica roll to hold the guard/fender cover securely on the vehicle.

Best **Proline**

- The front panel is a fire-resistant, reinforced heavy-duty PVC with gloss finish for ease of cleaning—as used for truck side curtains.
- The rear panel is a soft wool fire-resistant fabric to protect the paint finish.
- The encased sandwich of foam absorbs the impact of a dropped tool or part.
- Shaped for wheel arch, for mechanic's comfort.
- Tool gutter for holding tools/parts being used for the job in place.
- Weighted desiccated silica roll to hold the guard/fender cover securely on the vehicle.
